

content = ""# CallMind AI — Combined Web Design, Frontend, SEO, GEO
& AEO Specification

****Product:**** CallMind AI

****Industry:**** Real Estate

****Document Type:**** Developer-ready design and frontend specification

****Status:**** Development baseline

****Primary Goal:**** Help real estate teams convert property inquiries into qualified opportunities, human follow-ups, and booked viewings while maintaining clear human control.

1. Purpose

This document is the source of truth for the design, public website, and frontend development of CallMind AI.

It combines:

- Product UX requirements
- Web and application information architecture
- Page structure
- User journeys
- Component requirements
- Conversion and ROI principles
- Accessibility
- Responsive behavior
- Frontend architecture
- SEO compatibility
- GEO compatibility
- AEO compatibility
- Performance
- Security and privacy UX

- Product and visual constraints

The product must feel like a serious real estate operations platform that uses AI responsibly.

It must ****not**** look like a generic AI demo, chatbot clone, futuristic dashboard, or AI-generated template.

2. Product Context

CallMind AI is a real-estate-focused lead qualification and conversion platform.

Its MVP workflow is:

```text

Property Lead

Lead Added or Imported

Contact / Workflow Eligibility

AI Analysis

Property Requirements Extracted

Qualification Strategy Generated

Human Review and Approval

AI Engagement

Requirements Collected

The frontend must make this workflow understandable without requiring users to understand:

- Qwen
- LLM orchestration
- Agents
- Prompts
- Backend services
- Voice infrastructure
- Database architecture

AI should remain a product capability. It should not dominate the visual identity.

---

### **3. Product Surfaces**

CallMind AI has three distinct frontend surfaces.

#### **3.1 Public Marketing Website**

Purpose:

- Explain the product
- Establish credibility

- Capture demand
- Support search discovery
- Support AI answer systems
- Convert visitors into demos, pilots, or conversations

Requirements:

- SEO optimized
- GEO compatible
- AEO compatible
- Fast
- Accessible
- Server-rendered where appropriate
- Conversion focused

### **3.2 Authenticated Product Application**

Purpose:

- Manage leads
- Review AI analysis
- Approve qualification strategies
- Monitor engagement
- Handle escalations
- Book viewings
- Review activity

Primary priorities:

- Operational clarity
- Accessibility
- Performance
- Security
- Fast decision-making

Private product routes must not be indexed.

### **3.3 Knowledge and Content Layer**

Purpose:

- Explain real estate lead qualification
- Answer relevant questions
- Establish topical authority
- Support organic discovery
- Provide understandable information to search engines and AI systems

Potential content types:

- Guides
  - Use cases
  - Product documentation
  - FAQs
  - Comparisons
  - Glossary pages
  - Research and educational resources
- 

## **4. Primary Users**

### **4.1 Agency Owner / Sales Manager**

Goals:

- Understand pipeline performance
- Identify leads requiring attention
- Review AI-generated strategies
- Approve or reject workflows
- Monitor qualified opportunities
- Understand conversion bottlenecks
- Maintain control over automation

## **4.2 Real Estate Agent**

Goals:

- Understand a lead quickly
- See property requirements
- Review interaction outcomes
- Identify serious prospects
- Take over high-value opportunities
- Follow up efficiently
- Manage or book viewings

## **4.3 Operations User**

Goals:

- Add and import leads
  - Monitor workflow status
  - Resolve failed workflows
  - Track handoffs
  - Monitor appointments
- 

## **5. End-User Success Criteria**

A user should be able to answer these questions within seconds:

1. What requires my attention?
2. Which leads are highest priority?
3. What does this customer want?
4. What information is known?
5. What information is inferred?
6. What information is still missing?
7. Why was the lead classified this way?
8. What should happen next?
9. Can I override the recommendation?

10. What actions has the system already taken?

Primary UX objective:

**Reduce time-to-understanding and time-to-next-action.**

---

## 6. Core Conversion and ROI Principles

Every major interface should move users through:

Attention

Understanding

Decision

Action

Conversion

The business workflow is:

Lead

Fast Understanding

Qualification

Human Action

Viewing / Consultation

The design should reduce:

- Agent research time
- Time spent locating information

- Missed high-intent leads
- Approval friction
- Handoff friction
- Booking friction
- Repetitive qualification work

The product should not optimize for:

- Decorative dashboards
  - AI novelty
  - Excessive charts
  - Vanity metrics
  - Unnecessary interactions
- 

## **7. Design Direction**

The interface should feel:

- Professional
- Modern
- Calm
- Trustworthy
- Operational
- Clean
- Simplified
- Premium but restrained
- Easy to learn
- Suitable for daily professional use

## **Hard Visual Constraints**

Do NOT create:

- Generic AI visual styling
- Purple and blue neon gradients

- Glowing AI orbs
- Robot illustrations
- Circuit-board graphics
- Animated particles
- Futuristic HUD interfaces
- Excessive glassmorphism
- Chatbot-first layouts
- Excessive rounded cards
- Excessive shadows
- Decorative icons everywhere
- “AI magic” language

Desired perception:

A serious real estate operations platform that happens to use AI.

---

## **8. Visual System**

### **8.1 Color Philosophy**

Use a restrained neutral foundation.

Suggested starting design tokens:

--background: #F8F8F6;  
--surface: #FFFFFF;  
--surface-subtle: #F3F4F2;

--text-primary: #171717;  
--text-secondary: #666A66;  
--text-tertiary: #8A8E8A;

--border: #E5E6E3;  
--border-strong: #D4D6D1;

--primary: #1F3A32;  
--primary-hover: #162B25;

--success: #2F6B4F;  
--warning: #9A6A16;  
--danger: #A33A36;  
--info: #3E5F78;

These are starting points rather than final brand colors.

Rules:

- Use color sparingly.
- Do not use gradients by default.
- Do not communicate status through color alone.
- Pair important statuses with text and, where useful, icons.

## 8.2 Typography

Use one modern sans-serif typeface.

Suggested hierarchy:

Page Title: 28–32px

Section Title: 20–24px

Card Title: 15–18px

Body: 14–16px

Metadata: 12–14px

Requirements:

- High contrast
- Comfortable line height
- Limited font weights
- Avoid excessive bolding
- Avoid tiny metadata

- Maintain readable density

---

## 9. Layout System

### 9.1 Desktop Application Shell

Suggested dimensions:

Expanded sidebar: 240–260px

Collapsed sidebar: 64–72px

Content maximum width: approximately 1600px

Content padding: 20–40px

Avoid excessively wide text blocks.

### 9.2 MVP Navigation

Primary:

Overview

Leads

Appointments

Activity

Secondary:

Team

Settings

Do not expose future or unavailable features in navigation.

---

## **10. Information Architecture**

### **10.1 Authenticated Product**

#### **Authentication**

- Sign in
- Session states
- Access denied

#### **Overview**

- Pipeline summary
- Priority leads
- Recent activity
- Upcoming appointments
- Attention-required items

#### **Leads**

- Search
- Filters
- Lead table
- Lead creation
- CSV import

#### **Lead Detail**

The most important product screen.

#### **Strategy Review**

Can be embedded inside Lead Detail.

## **Interaction Detail**

- Conversation summary
- Timeline
- Outcome
- Escalation state

## **Appointments**

- Upcoming viewings
- Appointment details
- Status

## **Activity**

- Material workflow events
- Approval history
- Overrides
- Opt-outs
- Handoffs

## **Settings**

Only MVP configuration.

---

## **11. Overview Dashboard**

### **User Goal**

Immediately understand what requires attention and where conversion opportunities exist.

### **Header**

Good morning, [Name]

[Add Lead] [Import Leads]

Primary CTA:

**Add Lead**

Secondary CTA:

**Import Leads**

Do not create several competing primary CTAs.

**KPI Row**

Use actionable metrics only:

New Leads

Needs Review

Qualified

Viewings Scheduled

Avoid vanity metrics.

**Priority Section**

This should be visually dominant.

Title:

**Needs Your Attention**

Examples:

- Strategy awaiting approval
- Human handoff requested
- High-intent lead
- Failed interaction
- Missing required information

## **Simplified Pipeline**

New

Analyzed

Ready for Review

Approved

Engaged

Qualified

Viewing Scheduled

Do not make this unnecessarily complex.

## **Recent Activity**

Display chronological operational events.

---

## **12. Leads Page**

### **User Goal**

Find, understand, and act on leads quickly.

### **Structure**

Leads [Import] [Add Lead]

[Search.....]

[Status] [Intent] [Location] [Timeline] [More Filters]

---

| Lead       | Requirements     | Intent | Status | Action |
|------------|------------------|--------|--------|--------|
| Ahmed Khan | DHA, 3BR, Budget | High   | Review | →      |

---

### Recommended Visible Columns

- Lead
- Property requirement summary
- Intent
- Status
- Last activity
- Next action

Do not expose every database field.

### Search

Support:

- Name
- Phone or email
- Location
- Property type

### MVP Filters

- Status
- Intent
- Lead type
- Date

Avoid building an enterprise-grade filter builder during MVP.

---

## 13. Lead Detail — Primary Product Screen

### User Goal

Understand the customer and decide the next best action.

Recommended structure:

Breadcrumbs

Lead Name [Status] [More]

Contact Details

Source

Created Date

-----

[Overview] [Requirements] [Strategy] [Interaction] [Activity]

-----

Main Content

Right Action Panel

The action panel should prioritize the single most relevant next action.

### Overview Summary

Intent: High

Looking For:

3-bedroom apartment in DHA

Budget:

PKR ...

Timeline:

Within 2 months

Purpose:

Personal residence

Clearly separate:

### **What We Know**

Customer-provided or verified information.

### **AI Inference**

Information inferred by the system.

### **Still Unknown**

Information not yet collected.

Never blend these categories.

---

## **14. Property Requirements UX**

Display requirements structurally:

### **PROPERTY REQUIREMENTS**

Location

DHA Phase 6

Property Type

Apartment

Bedrooms

3

Budget  
PKR X – Y

Timeline  
1–2 months

Purpose  
Personal residence

Unknown information must display:

Not collected

Never use placeholders that look like actual customer information.

---

## **15. AI Analysis UX**

Do not present AI analysis as a long chatbot response.

Use structured blocks:

AI Lead Analysis

Intent  
High

Confidence  
High / Medium / Low

What We Know

- ...
- ...

Inferred Context

- ...

Still Need to Ask

- ...
- ...

A user should understand the output in approximately 15 seconds.

---

## **16. Strategy Review and Approval**

### **User Goal**

Control what the AI is allowed to do before engagement.

The UI must communicate:

AI Recommendation  $\neq$  Automatic Action

Show:

Qualification Strategy

Objective

Questions AI Will Ask

Required Information

Qualification Criteria

Escalation Conditions

Approved Scope / Boundaries

Actions:

[Reject] [Edit] [Approve Strategy]

Primary CTA:

## **Approve Strategy**

Engagement must remain unavailable until required approval exists.

---

## **17. Interaction UX**

Do not design the interaction area as a ChatGPT clone.

The user is reviewing an operational interaction.

Use a timeline:

Call Started

09:32

AI Disclosure Completed

09:32

Customer Interested

09:33

Budget Collected

09:34

Human Requested

09:36

Conversation Ended

09:36

A transcript may appear below or in a secondary panel.

Top summary:

Outcome: Human Handoff Required

Summary:

Customer is looking for ...

Key Requirements:

...

Recommended Next Action:

Contact customer within ...

---

## **18. Qualification Result UX**

Qualification must be explainable.

Example:

### **QUALIFICATION RESULT**

High Intent

Why:

- ✓ Specific location identified
- ✓ Defined budget
- ✓ Near-term timeline
- ✓ Requested viewing

Confidence:

High

Recommended Action:

Assign Agent / Book Viewing

Actions:

[Override Classification]

[Assign Agent]

[Book Viewing]

Never show only an unexplained AI score.

---

## **19. Human Handoff UX**

When escalation occurs, reduce cognitive load.

Create a concise handoff brief:

CUSTOMER

Name + contact

LOOKING FOR

Structured requirement summary

CONVERSATION

Short summary

WHY HANDOFF

Customer requested human / high intent / complex question

RECOMMENDED NEXT ACTION

...

Primary CTA:

### **Take Over Lead**

The agent should not need to read the entire transcript before acting.

---

## 20. Booking UX

### User Goal

Convert qualified interest into a confirmed viewing or consultation.

Flow:

Select Appointment Type

Select Available Slot

Confirm Customer Details

Confirm Appointment

Confirmation:

Viewing Confirmed

Date

Time

Property / Consultation

Assigned Agent

[View Appointment]

Avoid unnecessary steps.

---

## 21. Status System

Use consistent workflow vocabulary:

New

Analyzing

Ready for Review

Approved  
Engaging  
Qualified  
Follow-up Required  
Human Handoff  
Viewing Scheduled  
Converted  
Opted Out  
Failed

Every status requires:

- Human-readable label
- Clear meaning
- Defined next transitions

Do not rename the same state across different pages.

---

## **22. Empty States**

Every empty state must guide the user.

Bad:

No leads found.

Better:

Your lead pipeline is empty.

Add a lead manually or import a CSV to begin qualification.

[Add Lead] [Import CSV]

Every empty state should answer:

## What should I do next?

---

### 23. Loading States

Do not use unexplained spinners for long AI operations.

Use contextual progress:

Analyzing Lead

Extracting Property Requirements

Identifying Missing Information

Preparing Qualification Summary

If exact progress is unavailable, do not fake percentages.

---

### 24. Error States

Every error should explain:

1. What happened
2. What was not completed
3. What the user can do next

Example:

Lead analysis could not be completed.

No qualification decision was created.

[Try Again] [Contact Support]

Never silently treat incomplete AI output as successful.

---

## 25. Accessibility Requirements

Minimum requirements:

- Semantic HTML
- Keyboard navigation
- Visible focus states
- Logical tab order
- Accessible form labels
- Error messages associated with inputs
- Sufficient color contrast
- Statuses not represented by color alone
- Accessible icon buttons
- Focus trapping in dialogs
- Focus restoration after dialogs
- No required understanding through animation
- Respect `prefers-reduced-motion`

Target modern WCAG AA-level practices where applicable.

Accessibility must be implemented during development, not added as final polish.

---

## 26. Responsive Behavior

### Desktop

Primary workflow environment.

Optimize primarily for:

1280px–1920px

## **Tablet**

Navigation may collapse.

Prioritize:

- Lead summary
- Next action
- Qualification result
- Property requirements

## **Mobile**

Do not reproduce the entire desktop dashboard.

Prioritize:

- Priority leads
- Lead summary
- Handoff
- Approval and rejection
- Appointment confirmation

Tables should transform into simplified lists or cards.

Do not require horizontal scrolling for critical workflows.

---

## **27. Component System**

Build reusable primitives.

### **Core UI**

Button  
IconButton  
Input  
Textarea  
Select  
Combobox  
Checkbox  
Radio  
DatePicker  
Modal  
Drawer  
Tooltip  
Popover  
DropdownMenu  
Tabs  
Breadcrumbs  
Pagination

## **Data Display**

Table  
DataCard  
MetricCard  
StatusBadge  
Timeline  
EmptyState  
ErrorState  
LoadingState  
ProgressIndicator

## **Domain Components**

LeadCard  
LeadSummary  
RequirementGrid  
AIAnalysisPanel

FactInferenceUnknownBlock  
QualificationStrategy  
ApprovalPanel  
InteractionTimeline  
QualificationResult  
HandoffBrief  
AppointmentCard  
AuditEvent  
NextActionPanel

Avoid duplicate page-specific components for the same UI problem.

---

## **28. Frontend Architecture**

Recommended baseline:

Next.js  
TypeScript

Use modern patterns:

Server Components where appropriate  
Client Components only where interaction requires them  
Route-level loading states  
Route-level error boundaries  
Typed API contracts  
Runtime schema validation

Do not make every component a client component.

---

## **29. State Management**

**Server State**

Examples:

- Leads
- Strategies
- Interactions
- Qualification results
- Appointments
- Activity

Use a server-state and data-fetching approach compatible with the selected Next.js architecture.

### **Local UI State**

Use component or feature-level state for:

- Modals
- Filters
- Temporary form input
- Tabs
- UI preferences

### **Global State**

Use only for genuinely shared, long-lived application state.

Avoid placing every variable into a global store.

---

## **30. API Integration Rules**

Frontend code must not contain:

- Provider secrets
- Model credentials
- Voice provider credentials
- Bypassable policy logic

The backend remains authoritative for:

- Tenant authorization
- Approval state
- Policy decisions
- AI execution
- Qualification persistence
- External actions

Use typed request and response contracts.

Never assume raw AI output is valid.

---

## **31. Form UX**

Forms should be short and progressive.

### **Add Lead**

Only request information necessary to begin:

Name

Contact Method

Lead Source

Existing Inquiry / Notes

Optional structured data can be added if already known.

Do not force users to manually enter information the system can extract from the inquiry.

Validate inline.

Example:

Phone number is required to initiate voice engagement.

Do not show validation errors before meaningful interaction or submission.

---

## **32. Microcopy**

Prefer:

Approve Strategy

Take Over Lead

Book Viewing

Needs Review

Follow-up Required

Information Missing

Avoid:

Unlock AI Magic

Supercharge

Generate Magic

Ask the Brain

Autopilot Everything

Language must remain direct, professional and relevant to real estate workflows.

---

## **33. Motion**

Motion should orient users, not decorate screens.

Allowed:

- Short transitions
- Panel transitions
- Loading feedback
- Status changes

- Modal and drawer movement

Avoid:

- Constant floating elements
- Animated backgrounds
- Decorative particles
- Long entrance sequences

Respect:

@media (prefers-reduced-motion: reduce)

---

## **34. Performance Requirements**

Priorities:

- Fast initial rendering
- Small client bundles
- Lazy-load non-critical UI
- Optimize images
- Paginate or virtualize large lead lists when required
- Avoid duplicate API requests
- Cache safe server data appropriately

Routine actions should not require full-page reloads.

Use optimistic updates only when failures can be safely reversed.

Do not optimistically show irreversible external actions as completed.

---

## **35. Security and Privacy UX**

Requirements:

- Avoid unnecessary exposure of lead information
- Mask sensitive values where appropriate
- Confirm destructive actions
- Clearly communicate access denial
- Avoid placing sensitive lead data in URLs
- Respect tenant boundaries
- Do not expose secrets through client logs

Private customer information must never become indexable public content.

---

## 36. PUBLIC WEBSITE INFORMATION ARCHITECTURE

The public website should be structurally separate from the authenticated application.

Suggested structure:

```
/
|
|— solutions/
| |
| |— real-estate-agencies/
| |— real-estate-brokerages/
| |— property-developers/
|
|— use-cases/
| |
| |— real-estate-lead-qualification/
| |— ai-property-lead-follow-up/
| |— property-viewing-booking/
| |— real-estate-lead-routing/
|
|— features/
| |
| |— ai-lead-qualification/
| |— human-approval/
| |— property-requirement-extraction/
| |— ai-engagement/
```

Every public page must have a clear purpose.

Do not create thin pages simply to target keywords.

---

### 37. PUBLIC WEBSITE CONVERSION UX

The public website should follow:

Problem

Who It Is For

How CallMind Works

Product Value

Human Control and Trust

Relevant Use Case

Proof / Demonstration

## Primary CTA

The homepage should communicate value within the first viewport.

Suggested value proposition direction:

Qualify real estate leads faster, understand buyer requirements, and route serious prospects toward your agents and viewings with responsible AI.

Primary CTAs should remain focused.

Examples:

Request a Demo

Join the Pilot

Talk to Us

Avoid multiple unrelated conversion goals.

---

## 38. SEO REQUIREMENTS

SEO applies primarily to public pages.

### 38.1 Indexation Policy

|                        |                                |
|------------------------|--------------------------------|
| Public marketing pages | → index                        |
| Solution pages         | → index                        |
| Use-case pages         | → index                        |
| Substantive guides     | → index                        |
| Product documentation  | → index when public and useful |
| Login                  | → noindex                      |
| Signup                 | → noindex where appropriate    |
| Dashboard              | → noindex                      |

|                        |                 |
|------------------------|-----------------|
| Lead records           | → noindex       |
| Appointments           | → noindex       |
| Activity and audit     | → noindex       |
| Private tenant content | → never index   |
| Internal API routes    | → not indexable |

## 38.2 Technical SEO Requirements

Implement:

- Semantic HTML
- Logical heading hierarchy
- Unique title tags
- Unique meta descriptions
- Canonical URLs
- XML sitemap
- robots.txt
- Open Graph metadata
- Social metadata where relevant
- Optimized images
- Responsive design
- Fast rendering
- Clean internal linking
- Stable URL structures

Avoid:

- Duplicate content
- Keyword stuffing
- Empty SEO pages
- Automatically generated low-value content
- Hidden text
- Misleading metadata

## 38.3 Content SEO Requirements

Every indexable page should have:

1. One primary search intent
2. Clear H1
3. Direct introduction
4. Substantive explanation
5. Relevant internal links
6. Clear CTA
7. Accurate product claims

Content should use real estate terminology naturally.

---

### **39. GEO REQUIREMENTS**

GEO here means optimizing content so AI-powered discovery and answer systems can accurately understand, retrieve and represent CallMind AI.

Every important public page should make the following clear:

- What CallMind AI is
- Who it is for
- What problem it solves
- How it works
- What AI does
- What humans control
- What the product does not do

Use concise factual statements before detailed explanations.

Example:

CallMind AI is a real estate lead qualification and conversion platform that helps teams analyze property inquiries, structure buyer requirements, support controlled AI engagement, identify qualified prospects, route high-intent opportunities to agents, and support viewing booking.

## **GEO Content Rules**

Use:

- Clear terminology
- Consistent entity descriptions
- Stable product naming
- Structured facts
- First-party explanations
- Explicit workflow descriptions
- Dates and updates where relevant
- Evidence for measurable claims

Do not publish unsupported claims such as:

- Guaranteed conversion
- Fully autonomous selling
- Replacing real estate agents
- Perfect lead scoring

Maintain explicit human-control boundaries.

---

## **40. AEO REQUIREMENTS**

AEO means structuring content so important user questions can receive clear, direct answers.

Important pages should target actual questions such as:

- What is AI lead qualification for real estate?
- How can AI help real estate agents qualify leads?
- How can real estate teams reduce response time?
- Can AI collect property requirements?
- Can AI help book property viewings?
- Does CallMind AI replace real estate agents?
- How does human approval work in CallMind AI?

## **Recommended AEO Structure**

Question / Search Intent

Direct Answer

How It Works

Supporting Detail

Examples

Relevant FAQ

Related Resources

The direct answer should usually appear early on the page and clearly answer the query.

Do not bury the answer below generic marketing copy.

Use FAQ sections only where the questions are genuine and useful.

---

## **41. Structured Data Requirements**

Where supported by the actual page content, implement relevant structured data.

Possible types include:

- Organization
- SoftwareApplication
- Product
- WebSite
- WebPage
- Article

- BreadcrumbList
- FAQPage only for genuine FAQs

Rules:

- Structured data must match visible content.
- Do not add misleading structured data.
- Do not mark private application content as public product content.
- Do not create fake reviews or ratings.

Structured data should be generated through reusable, typed utilities.

---

## **42. SEO + GEO + AEO CONTENT COMPONENTS**

Create reusable public-content components:

Hero

ProblemStatement

AudienceSection

HowItWorks

FeatureGrid

WorkflowDiagram

UseCaseSection

TrustAndControlSection

FAQ

RelatedResources

AuthorOrPublisherInfo

LastUpdated

CTASection

Breadcrumbs

These components should support consistent semantic structure and metadata.

---

### 43. Suggested Frontend Folder Structure

src/

The exact structure may evolve, but public marketing, private application, SEO utilities and product domains should remain clearly separated.

---

## 44. Frontend Development Constraints

The frontend developer must NOT:

- Invent product features outside approved scope
- Add fake AI capabilities
- Add fake analytics
- Hard-code business decisions that belong to backend services
- Embed provider-specific logic into UI components
- Duplicate policy logic in the browser
- Add navigation for unavailable future features
- Overload screens with charts

- Replace explainable qualification with opaque scores
- Hide human controls
- Expose private tenant data to search engines
- Create SEO pages without substantive value
- Make unsupported marketing claims

The frontend developer SHOULD:

- Build reusable components
  - Keep terminology consistent
  - Use structured AI output
  - Make workflow states obvious
  - Prioritize the next action
  - Design for daily professional use
  - Keep critical information visible
  - Support responsive workflows
  - Build accessibility from the beginning
  - Treat loading, empty and error states as first-class requirements
  - Maintain SEO, GEO and AEO compatibility on public pages
- 

## **45. Build Priority**

### **P0 — Product Foundation**

1. Authentication shell
2. Dashboard layout
3. Leads list
4. Add/import lead
5. Lead detail
6. AI analysis display
7. Property requirements
8. Strategy review and approval
9. Qualification result
10. Human handoff

11. Booking
12. Loading, empty and error states

## **P0 — Public Foundation**

13. Marketing layout
14. Homepage
15. Core product/solution pages
16. Metadata system
17. sitemap
18. robots configuration
19. Canonical URL system
20. Structured data utilities

## **P1**

21. Interaction detail
22. Activity/audit page
23. Advanced filters
24. Responsive refinement
25. Use-case pages
26. Resource/content system
27. FAQ and AEO components

## **Later**

28. Advanced analytics
29. CRM integrations
30. Property matching
31. Multi-agent routing
32. Advanced campaign controls
33. Expanded content clusters

---

## **46. Definition of Done**

A frontend feature is complete only when:

- The intended user can complete the task
- Loading state exists
- Empty state exists where applicable
- Error state exists
- Responsive behavior is considered
- Keyboard interaction works
- API response states are handled
- Sensitive data is protected
- The primary next action is clear
- The feature matches approved product scope
- Reusable components are used where appropriate

For a public page, also verify:

- Clear primary intent
  - Unique metadata
  - Correct canonical URL
  - Semantic heading structure
  - Internal links where relevant
  - Mobile usability
  - Accessibility
  - Appropriate index/noindex policy
  - Accurate structured data where applicable
  - Clear answer to the page's primary question
  - No unsupported claims
- 

## **47. End-to-End Product UX Acceptance Test**

A real estate user must be able to:

1. Sign in
2. Open the dashboard

3. Identify leads requiring attention
4. Add or import a property lead
5. Open the lead
6. Understand what the customer wants
7. Distinguish known information, AI inference and unknowns
8. Review the qualification strategy
9. Approve or reject it
10. Monitor engagement
11. Review the qualification result and explanation
12. Take over a lead when required
13. Create or confirm a viewing or consultation
14. See the outcome reflected in workflow and activity history

The interface succeeds if this can be completed without understanding internal AI or backend architecture.

---

## **48. Public Website Acceptance Test**

A potential customer should be able to:

1. Land on a relevant public page
2. Understand what CallMind AI does
3. Understand who it is for
4. Understand the specific real estate problem it addresses
5. See how the workflow operates
6. Understand where human control exists
7. Find a direct answer to their primary question
8. Navigate to a relevant use case or feature
9. Reach a clear conversion action

Search engines and AI answer systems should be able to identify:

- The organization or product
- The real estate focus

- The product's primary capabilities
  - The workflow
  - The intended users
  - Human oversight boundaries
- 

## 49. Final Design Standard

The product must communicate:

**This is a serious real estate operations platform that uses AI to reduce repetitive work and help teams convert qualified opportunities.**

Not:

**This is an AI experiment with a dashboard attached.**

The visual and information hierarchy must prioritize:

Customer

Property Requirements

Lead Intent

Workflow Status

Recommended Action

Human Decision

Conversion Outcome

The public website must prioritize:

Search Intent

## 50. Final End-User Goal

CallMind AI should help real estate teams:

- Respond faster
- Understand every property lead
- Structure customer requirements
- Identify genuine opportunities
- Reduce repetitive qualification work
- Maintain human control over consequential actions
- Route serious prospects to the right person
- Reduce time from inquiry to follow-up
- Move qualified prospects toward booked viewings or consultations
- Improve operational efficiency and conversion outcomes

The frontend, public website, and content system should work together toward this single outcome:

**Make it easier for real estate teams to discover, understand, trust, adopt, and use CallMind AI to turn property inquiries into qualified human opportunities.**
